

# Simplify waste collection!

Compostable packaging can be disposed of together with food waste, no sorting needed.

And no contamination for recyclable waste streams - the sad truth about paper or plastic recycling for food packaging is that once you put food on a plate it becomes dirty and cannot be recycled. Same rule for all your pretty acai bowls and chia smoothies, they all end up at the landfill - not so pretty, right?

But when food packaging is compostable and disposed together with food waste it can be processed and turned into compost. And used to grow more food.
